Dynamic tongue movements in L1 Japanese and L2 English liquids

Takayuki Nagamine

Lancaster University, UK
t.nagamine@lancaster.ac.uk

The Japanese /r/ - /l/ problem

(Flege, J. E., Aoyama, K., & Bohn, O.-S., 2021, p. 84)

- L1 categories influence L2 speech production:
 - Japanese (1 liquid: taps/flaps) vs English (2 liquids: /l ɹ/)
- “[N]ative Japanese speakers have little or no experience with the precise articulatory configurations required for English /ɹ/ and /l/ production” (Bradlow, 2008, p. 293)
- However, there isn’t much articulatory research!
(cf. Masaki et al., 1996; Moore et al., 2018; Morimoto, 2021; Zimmermann et al., 1984)
- **Then, what exactly are we struggling with?**
(e.g., Flege, 1995; Gick, Bernhardt, Bascfalvi, Wilson & Oh, 2007; Harper, Goldstein & Narayanan, 2016)

English and Japanese liquids: Midsagittal ultrasound

Dynamics in English liquids

- Japanese and English liquids may differ in gestural coordination:
 - English: Dynamic coordination of coronal and dorsal gestures.
 - Japanese: Coronal (and/or dorsal), strong vocalic coarticulation
(e.g., Yamane, Howson & Po-Chun, 2015; Proctor, Walker, Smith, Szlay, Goldstein & Narayaan, 2019; Morimoto, 2020)
 - **Lack of tongue retraction** and **strong vocalic coarticulation** of Japanese [r] may characterise L2 English liquids produced by L1 Japanese speakers (Zimmermann et al., 1984)
- However, existing studies are based on ‘static’ pictures at one point in time, when English liquids show dynamic characteristics in articulation.
- **Liquid-vowel dynamics may offer finer-grained accounts on the Japanese /r/-/l/ problem?**

Research question

**What articulatory dimensions characterise L2
English liquids produced by L1 Japanese speakers?**

keywords: ultrasound / dynamic analysis

Methods

- Participants
- Recording
- Materials
- Analysis

Participants

L1 Japanese speakers ($N = 17$)

- 8 female, 9 male ($M_{age} = 19.76$, $SD = 0.97$)
- Studying English as a foreign language in Japan
- Overseas experience: ~ 4 months

L1 North American English speakers ($N = 12$)

- 10 female, 2 male ($M_{age} = 29.08$, $SD = 6.30$)
- From US ($n = 8$) or Canada ($n = 4$)

believe bereave biribiri(びりびり)

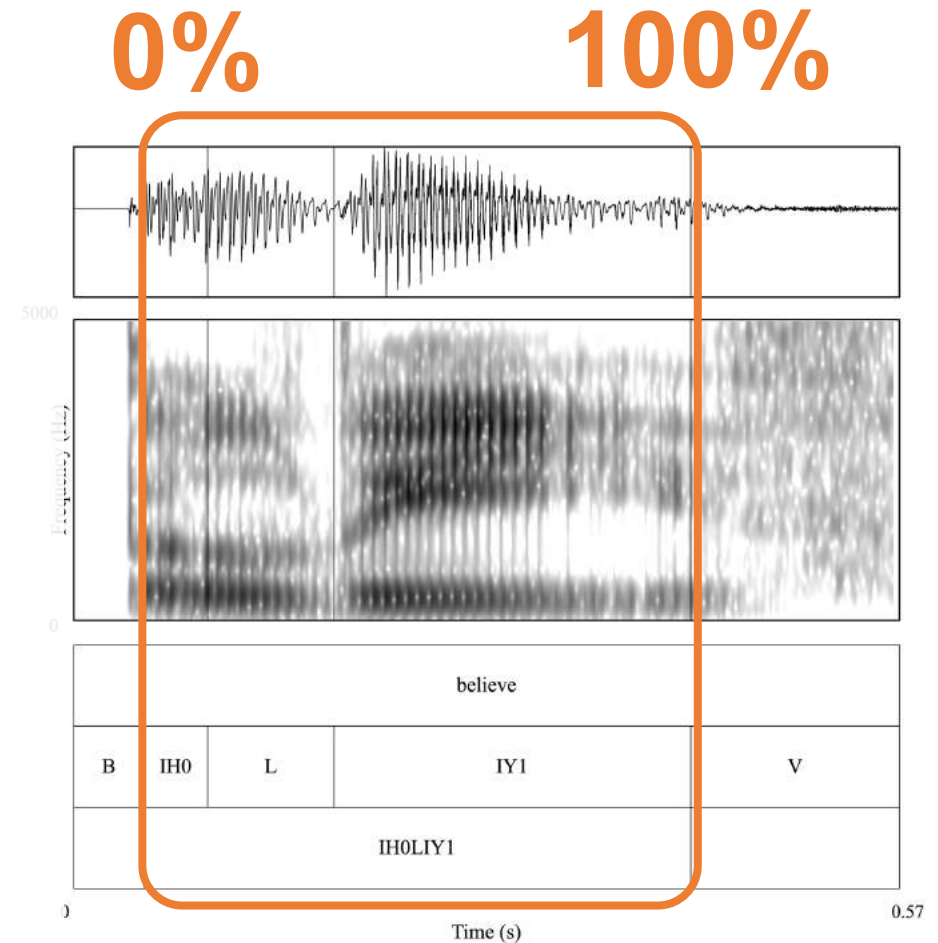

- Intervocalic syllable-initial liquids
- Read in isolation one by one
- Articulate Assistant Advanced (AAA)
 - 80mm depth
 - 100% FOV
 - ca. 80 frames per second
- 271 tokens in total

	Speaker's L1		
	English	Japanese	Total
Prompt			
believe	52	59	111
bereave	57	56	113
biribiri	0	47	47
Total	109	162	271

Dynamic ultrasound analysis

Dynamic analysis

- Vowel – liquid – vowel intervals are delimited acoustically.
believe bereave biribiri
- Tongue shapes are extracted at 11 equidistant timepoints **during the interval**.
 - Normalised time: 0% = V1 onset, 100% = V2 offset

2023 Results

Dynamic changes of PC1 (tongue retraction)

PC1 tongue retraction
58.03%

Magnitude / Timing

believe

believe: PC1 (tongue retraction)

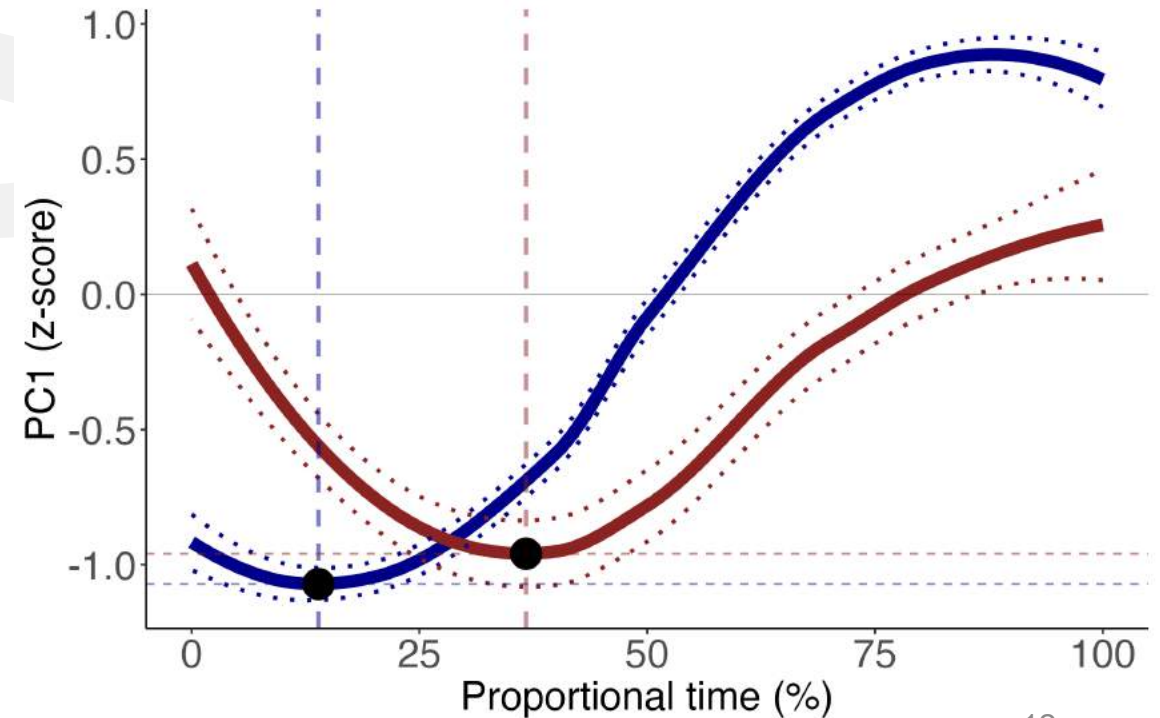

■ L1 English ■ L1 Japanese

bereave

bereave: PC1 (tongue retraction)

■ L1 English ■ L1 Japanese

Discussion

- **TD movement as ‘L1 articulatory habit’**

- Smaller degree of tongue retraction for /l/
- Later achievement of tongue retraction for /ɹ/
- cf. lack of tongue retraction, stronger vocalic coarticulation

(Zimmermann et al., 1984)

- The liquid-vowel dynamics offers finer-grained accounts of the Japanese /r/-/l/ problem:

- Dynamic information might be part of L2 phonological representation, similarly to vowels. (e.g., Schwartz and Kaźmierski, 2020)
- How about acoustics? How about other vowel contexts?
- Pronunciation teaching textbook?

Conclusion

What articulatory dimensions characterise L2 English liquids produced by L1 Japanese speakers?

- **Overall smaller degree of tongue retraction**
- **Timing (/ɹ/) and magnitude (/l/) difference**

What exactly are we struggling with?

- **Tongue retraction (TD gesture)**
